

TP8-64

Expandable serial alarm system

The TP8-64 alarm system has been especially designed to offer solutions for the protection of small and medium-sized sites, guaranteeing the highest standards of security.

Tecnoalarm
Hi-Tech Security Systems
design by *pininfarina*

The Tecnoalarm systems which are equipped with the RSC (Remote Sensitivity Control) technology communicate with the monitoring station and transmit specific and detailed information. The Tecnoalarm monitoring station can program and constantly monitor the system from a distance and, using sophisticated diagnostic tools, check the functioning and obtain the necessary information to maintain and improve its performance.

Programming

Programming of the systems' functioning parameters can be made locally or remotely, via telephone line, using the Tecnoalarm software. The software provides numerous programming tools which permit customization of the installation selecting the most appropriate settings among the options available.

Zones

System configuration is entirely modular thanks to the input expansion modules. The 8 hard-wired inputs of the CPU constitute the basic version of the system. They are expandable to a total of 64 zones which can be freely associated to the hard-wired and wireless inputs of the connected hardware (max. 64 hard-wired zones and max. 32 wireless zones).

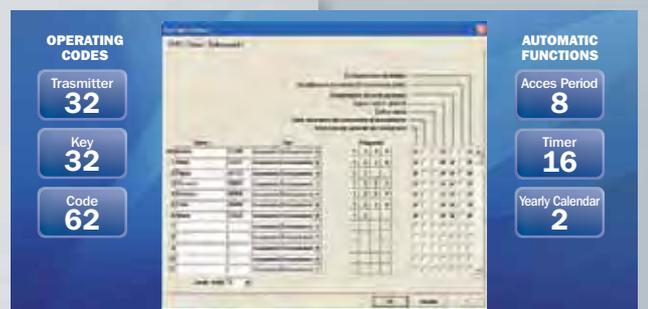

The zone programming facilities allow to obtain excellent performances even from traditional detectors but the best results are obtained by using the Tecnoalarm RDV and RSC detectors. These detectors permit the verification and analysis of the alarms at the very moment they are released through the specific diagnostic tools of the monitoring software.

In this way, the limitations of traditional remote management have been overcome and a new concept of interaction has been proposed. (RDV® and RSC® are registered trademarks and protected by international patents)

Programs and control units

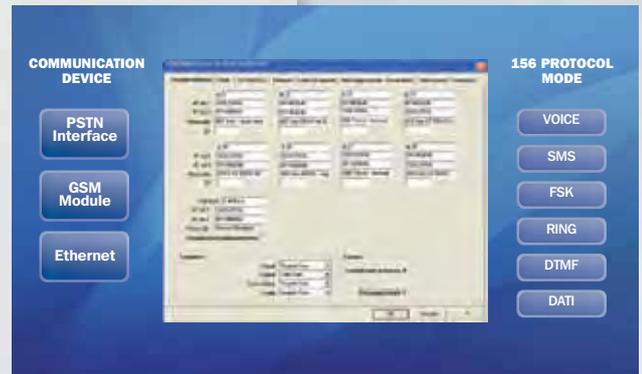

The TP8-64 system manages 8 programs. A wide range of control units, composed of LCD consoles with voice synthesis, transponders and wireless keys, is able to satisfy any application requirements. The users have access to the system's functions through 64 codes, 32 transponders and 32 wireless keys. Access to the protected areas can be automated and regulated by 8 access periods and 16 timers.

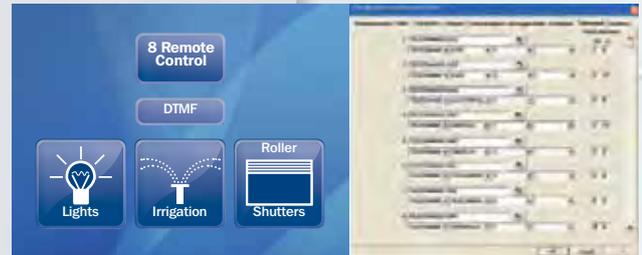

Telephone section

The telephone section provides 8 telephone channels. The TP8-64 system uses the PSTN line and optionally the GSM or Ethernet network through respectively the external GSM communicator TECNOCELL-PRO PL and the PROG NET2 Ethernet interface. The telephone section uses several communication formats: voice calls, SMS, data transmission in FSK, DTMF and TCP/IP formats. The alarm and system status messages are automatically composed by the system using the onboard vocabulary. The TP8-64 system is able to communicate with the user and the central monitoring stations using 156 communication protocols.

Interaction

The TP8-64 system provides 8 remote controls which allow the user to interact with the system through telephone calls. A guided voice menu makes the communication with the system easier and helps the user to execute the commands. The remote controls are customizable and permit the management of the system's functions as well as the interaction with external devices such as heating, air-conditioning, lighting equipment etc.

Wireless section

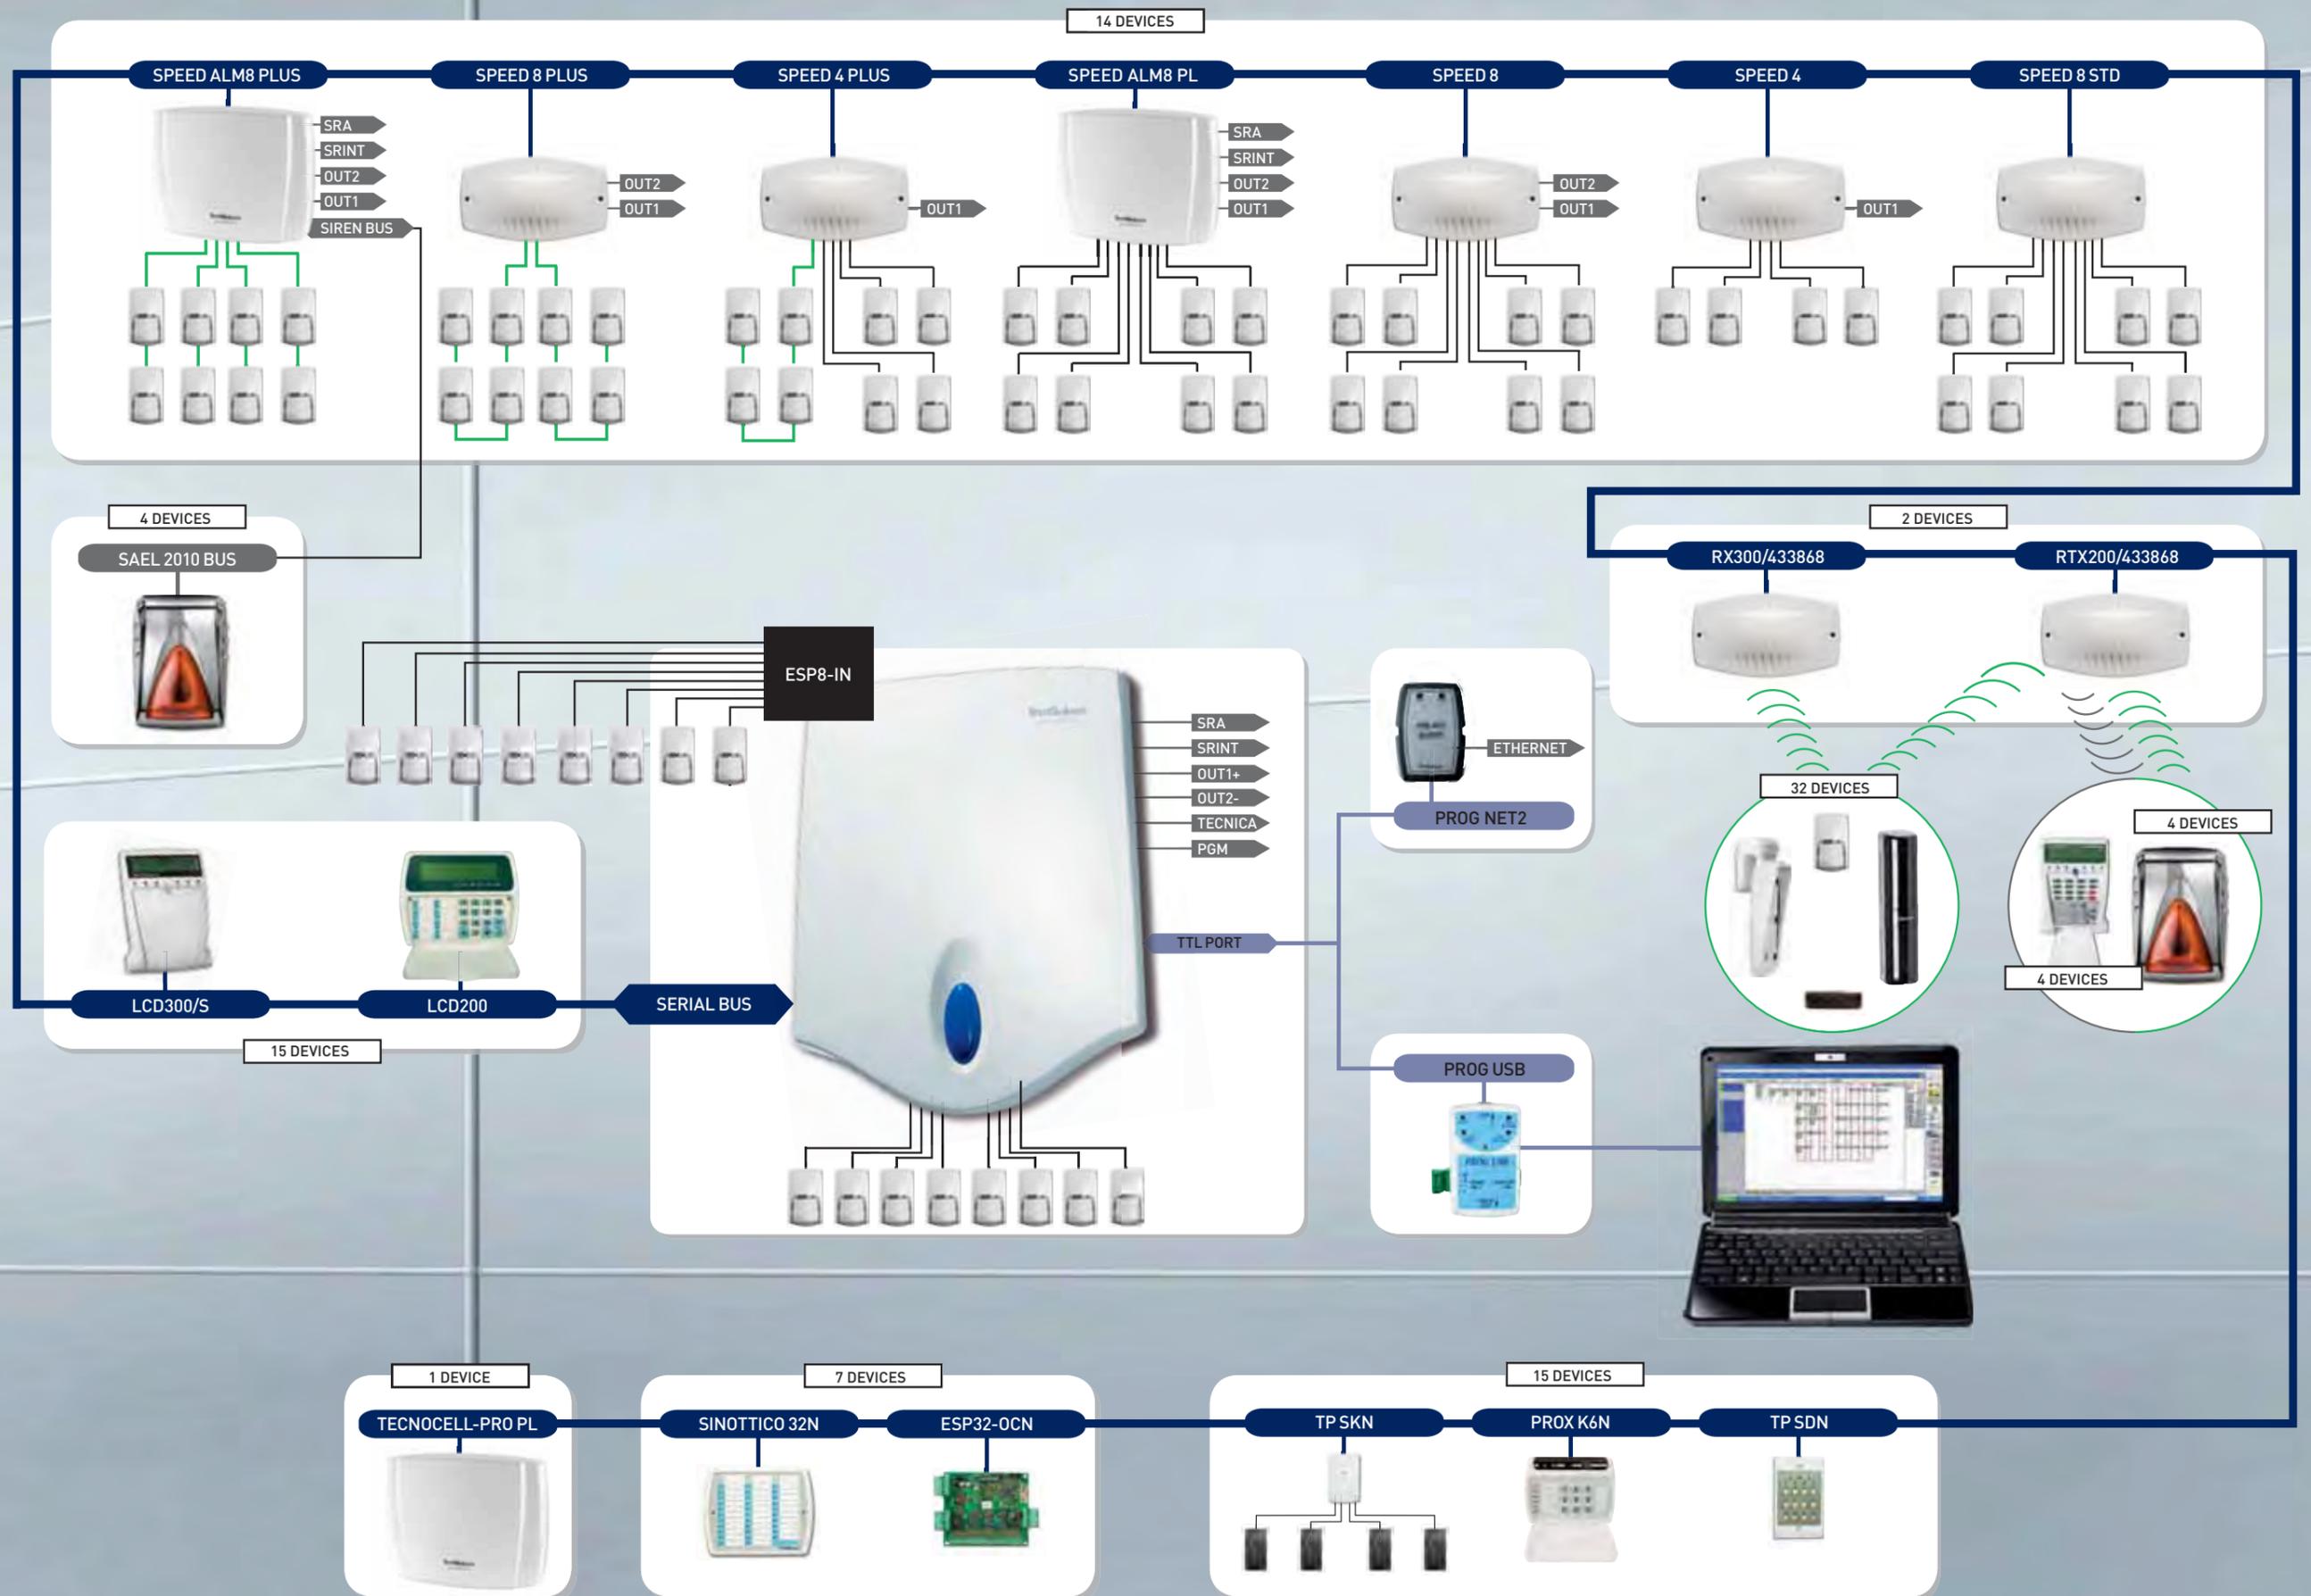

The expansion of the system is possible, even if cable laying is complicated, by the installation of maximum 2 wireless receivers or receiver-transmitters able to manage a total of 32 wireless keys and 32 detectors as well as 4 wireless consoles and 4 sirens (RTX200/433868). The wide range of Tecnoalarm wireless detectors, comprising indoor and outdoor detectors as well as perimeter protections, offers ideal solutions for all protection requirements.

Event log

The event log contains all the events relating to the system's functioning, i.e. the alarms, the diagnostics and the changes of status. A total of 1000 events can be recorded, in reverse chronological order, with indication of date and time. For each event, detailed information is given about the interested zones, programs and remote controls, identified by a number and a description, as well as the telephone calls. The installer can download the event log at any time using the Tecnoalarm software to extract the necessary information to verify the system's smooth functioning.
